                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        chimeric Hepatitis C virus (HCV)-pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a peptide from the tethered NS4A cofactor sequence from HCV NS3, which was used to illustrate the present
                                                                 The present sequence comprises residues 21-31 of the Hepatitis C virus (HCV) NS4A protease enzyme. It was used to create a number of fusion proteins also containing the HCV NS3 protease. The NS4A and NS3 proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid construct encoding chimeric Hepatitis C Virus (HCV) pestivirus genome where the Npro protease gene is replaced with NS3 protease gene, useful for in vivo screening of compounds which inhibit HCV infection
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a nucleic acid construct encoding a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes methods and compositions capable of preventing the replication of hepatitis C virus (HCV), involving administering a compound which inhibits NS2/3 autocleavage. Also provided are peptides capable of inhibiting this cleavage step, of which this sequence is an example. These are useful in the treatment of HCV infection in humans and chimpenzees, and in research applications, for example in studying the stabilisation of NS2/3, the effects of NS2/3 on HCV polyprotein processing and the effects of inhibiting NS2/3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cell, or

The present invention relates to a novel pyrrolopyrazinone derivative, its stereoisomer or salt. It was found that the derivative is a Hepatitis C virus (HCV) nonstructural (NS) 3 protease inhibitor. The derivative is useful for the manufacture of a medicament for the treatment of HCV and in therapy for treating HCV infection. The present peptide was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel ketoamide and ketoester derivatives for use as inhibitors of hepatitis C virus (HCV) NS3 protease inhibitors. The compounds are useful for treating viral infections e.g. hepatitis C virus. The present sequence was used in an experiment measuring the effect of an inhibitor on the rate of hydrolysis of an ester substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New ketoamide derivatives useful for treating infections e.g. hepatitis
                                                                                                                                                                                       New pyrrolopyrazinone derivatives useful for treating Hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus, HCV, NS3 protease; alpha-ketoamide inhibitor;
virucide; hepatotropic; antiinflammatory; viral infection; KKNS4a.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the amino acid sequence of the novel sNS4A (synthetic Hepatitis C nonstructural protein 4A) peptide. It acts as a cofactor for the NS3 protease in order to achieve proteclytic processing of Hepatitis C virus (HCV) nonstructural proteins. It is used in the method of the invention as part of a device which can be used to provide information for the design of drugs for the treatment of HCV infection. They can also be used for determining the 3-dimensional structure of molecules or molecular complexes which contain at least some structurally similar features to a HCV NS3 serine protease domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Virucidė: pyrrolopyrazinone derivative; Hepatitis C virus inhibitor; nonstructural 3 protease; NS3 protease; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hepatitis C virus crystal compositions - comprising a HCV NS3-like polypeptide complexed with a NS4A-like polypeptide, used particularly for drug design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

The present invention provides a number of boronic acid derivatives which act as inhibitors of the hepatitis C virus NS3 protease enzyme. They can be used to treat infection by the virus, which can cause liver cirrhosis and liver cancer.
                                                                                                                                                                                  New boronic acid derivatives, optionally containing peptides, used to treat hepatitis C infections, are hepatitis C viral protease inhibitors
                                                                                                                                                                                                                        Example 60; Page 208; 258pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to Lactam derivatives. These derivatives may be used for treating hepatitis C virus (HCV) infection. They can also be used for inhibiting HCV in a body fluid sample and as a standard or reagent in a test or assay for determining the ability of a potential pharmaceutical to inhibit HCV NS3 protease and/or HCV growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus; protease; boronic acid; inhibitor; liver cirrhosis;

The invention relates to pyrimidinones of a formula given in the claims of the specification, their stereoisomers, salts and prodrugs. In assays, the pyrimidinone compounds inhibited Hepatitis C virus (HCV) NS3 protease with IC_5 0 values of less than 100 micro M. The compounds are useful for treating viral infection e.g. HCV infection (the causative agent of acute hepatitis and associated with cirrhosis and liver cancer) and as a reagent used as inhibitors of HCV protease in the processing of blood plasma for diagnostic and other commercial purposes. The present sequence is a peptide, KNNS4a, used in an NS3 kinetic assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         salts or products which are useful as serine protease inhibitors.
The imidazolidinones of the invention may have virucide, hepatotropic, or antiinflammatory activities and may be used as a serine protease inhibitor (preferably Hepatitis C virus (HCV) NS3 protease inhibitor) or a HCV growth inhibitor. Compounds of the invention are useful for treating viral infection e.g. hepatitis C virus (HCV) infection and as a reagent used as inhibitors of HCV protease in the processing of blood plasma for diagnostic and other commercial purposes. The invention inhibit HCV NS3 protease and/or HCV HCV HCV NS3 protease and/or HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel imidazolidinones or their stereoisomers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             growth and thus can be used in the blood plasma assay. The present sequence represents the KKNS4a peptide used in enzyme assay experiments in the examples of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New imidazolidinones useful as serine protease inhibitors in the treatment of \mathbf{e}.\mathbf{g}. viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HCV; hepatitis C; imidazolidinone; serine protease inhibitor;
virucide; hepatotropic; antiinflammatory; NS3 protease; KKNS4a;
growth inhibitor; viral infection; blood plasma processing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to hepatitis C virus (HCV) core antigen and NS (nonstructural) 3/4a antibody combination assay that can detect both HCV antigens and antibodies present in a sample using a single solid matrix as well as immunoassay solid supports for use in the assay. The solid support is useful for detecting HCV infection in a biological sample. The present sequence is NS4A peptide which is used to purify NS3/4a conformational epitope in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4×2×4×
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a new immunoassay solid support consisting essentially of at least one hepatitis C virus (HCV) NS3/4a conformational epitope and a multiple epitope fusion antigen (MEFA).

Bound to the support. The NS3/4a conformational epitope and/or sample from an HCV-Infected individual. The immunoassay of the invention is useful for detecting hepatitis C virus infection in a biological sample. The method of the invention provides a sensitive, accurate diagnostic and prognostic tool to provide adequate patient care and to prevent transmission of HCV by blood and by blood products, or by personal contact. Use of NS3/4a conformational epitope in combination with MEFA, provides a sensitive and reliable method for detecting early HCV serconversion. Use of MEFA has the aded advantages of decreasing masking problems, improving sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit surface area of the incidence of false results is reduced because of the identification and the use of highly immunogenic HCV antigens which are present during the early stages of HCV serconversion. The present amino acid sequence represents the non-structural protein NS4A peptide sequence. The peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention relates to immunoassays comprising Hepatitis C Virus (HCV) N33/4a conformational epitope and multiple epitope fusion antigen (MEFA), bound to a solid support. The N33/4a epitope fusion the multiple epitope fusion antigen react with anti-HCV antibodies present in a biological sample from an HCV-infected individual. The immunoassays and methods of the invention are useful for detecting support provides a sensitive and reliable method for detecting early HCV seroconversion. The assays can detect HCV infection caused by any six known genotypes of HCV. The use of the multiple epitope fusion proteins decreases masking problems, improves sensitivity in detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunoassay solid support for detecting Hepatitis C Virus infection in biological samples, comprises Hepatitis C Virus conformational epitope and multiple epitope fusion antigen -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antibodies by allowing a greater number of epitopes on a unit area of substrate, and improves selectivity. The present sequence representing HCV type 1 (HCV-1) NS4a peptide is used in a protease enzyme activity assay in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Coit D;
                                                                              Immunoassay solid support; Hepatitis C Virus type-1; HCV-1; MS3/4a conformational epitope; multiple epitope fusion antigen; MEFA; anti-HCV antibody; MS3/4a conformational antigen; HCV infection; E2 hypervariable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of MS3 metants and MS3-MS4 fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor
                                                                                                                                                                                                                                                                                                                                              Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hepatitis; NS3 protease; viral replication; chronic liver disease;

                                                                                                                                                                                                                                                                                                                            The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HVV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                  Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

genome polyprotein - hepatitis C virus (strain HCV-1)
N'Contains: capsid protein C; envelope protein M; hepativitin (EC 3.4.21.98) (nonstru
N'Contains: capsid protein C; envelope protein M; hepativitin (EC 3.4.21.98) (nonstru
Drotein NS4s; nonstructural protein NS4b; nonstructural protein NS5
C; Species: hepatitis C virus
C; Daceles: hepatitis C virus
C; Accession: A39166; PQ0403; P00404

(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.21.98); Nonstructural protein NS48 (P4); Nonstructural protein NS48 (P57); Nonstructural protein NS58 (P56); Nonstructural protein NS58 (P56) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)]. Hepatitis C virus (Isolate Japanese) (HCV).
                                                                                                                                                                                  [RNA](N).
-1- SUBGUTT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

NONSTROCTURAL PROTEIN NS48 (POTENTIAL).
RNA-DIRECTED RNA POLYMERASE (POTENTIAL).
                              SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPPOFROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           POTENTIAL.

            FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT FLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.

CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

CATALYTIC ACTIVITY: N nucleoside triphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase;
Core protein; Coat protein; Envelope protein; Helicase; ATP-binding;
Transmembrane; Nonstructural protein; Hydrolase; Serine protease;
                                                                                                        SUBDINIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

PTH: THE STRUCTURAL PROTEINS C. E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.

SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY 039.

SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
  NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      REMOVED FROM CAPSID PROTEIN C BY THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PROTEASE/HELICASE NS3.

-!- CATALYTIC ACTIVITY: ATP + H(2)0 - ADP + phosphate.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STRAIN=CDC 1551 / Oshkosh;
